**HAEMATOLOGY**  
**BLEEDING TIME & CLOTTING TIME**

TEST DESCRIPTION	RESULT	REF. RANGE	UNIT
Bleeding Time	6	2 - 7	minutes
Clotting Time	8	4 - 11	minutes

**Interpretation:**

- The Bleeding Time Clotting Time (BTCT) test measures the time it takes for a small puncture wound to stop bleeding and the time it takes for a clot to form in a blood sample. This test is used to evaluate the function of platelets and coagulation factors in the blood, and to diagnose bleeding disorders.
- If your BTCT test results are outside the normal range, it may indicate a bleeding disorder, such as von Willebrand disease or a deficiency of clotting factors.
- A prolonged bleeding time may indicate that your platelets are not functioning properly, which can lead to increased bleeding and bruising. A prolonged clotting time may indicate a deficiency of coagulation factors, which can lead to excessive bleeding and difficulty in forming clots.

<b>A : G Ratio</b> Calculated	<b>0.64</b> <b>Low</b>	0.90 - 2.00	

**Note :**

1. In an asymptomatic patient, Non alcoholic fatty liver disease (NAFLD) is the most common cause of increased AST, ALT levels. NAFLD is considered as hepatic manifestation of metabolic syndrome.
2. In most type of liver disease, ALT activity is higher than that of AST; exception may be seen in Alcoholic Hepatitis, Hepatic Cirrhosis, and Liver neoplasia. In a patient with Chronic liver disease, AST:ALT ratio>1 is highly suggestive of advanced liver fibrosis.
